Tutorial

Introduction

Now that you have your Bone up and running, and Ethernet works, wouldn't it be nice to get rid of that Ethernet cable? Yeah, let's go WiFi! This tutorial is specifically for the verified WiFi adapter for Beagle Bone adapter in the Adafruit shop. It will not work with other WiFi adapters, as they all have different chipsets!

For this tutorial you will need:

- Beagle Bone
- WiFi adapter
- 5V 2000mA Power Adapter

Pick these parts up at the Adafruit shop!

Power and WiFi

The BeagleBone has the neat ability to power itself just through the mini USB port. However, this can cause some problems because the USB port cannot supply enough power for BOTH the Bone and a WiFi adapter.

Driver Install

You'll need to have Internet connectivity using Ethernet , and also be logged into the terminal to install the WiFi adpater's driver, so make sure to complete those tutorials first!

While logged in, type in opkg update and hit return, you should see the following

Troubleshooting

If you get an error device descriptor read/64, error -71, reboot and stop the boot process with the space bar. Then add the following boot option with the follow at the U-Boot prompt

setenv bootargs irqpoll RETURN

boot RETURN
