1. Safety Instructions

Thank you for purchasing our HerkuleX,

For your safety, please read the instruction manual before using the HerkuleX with particular attention to the safety instructions below.

1-1. Meaning of Symbols

Any sections within the manual with the following symbols require special attention to safety.

Danger

Ignoring the instructions with this symbol can lead to serious bodily injury or death to the user and to those near by and high possibility of damage to the property and equipment.

Warning

Ignoring the instructions with this symbol can lead to possible bodily injury and death to the user and to those near by and high possibility of damage to the property and equipment.

Caution

Ignoring instructions with this symbol may risk bodily injury.

1-2. Operating Precautions

Caution

Do not disassemble or modify the servo.

Do not use power sources other than the recommended battery.

Do not touch the servo casing immediately after the operation.

Keep away from water, sand, and dust.

Do not use the servo for purposes other than installation in the indoor robot,

Do not use overt force to turn the servo horn,

Servo should not be left if locked position.

1-3. Safe Battery Handling

Warning

Alwasy use the appropriate battery charger to charge the battery pack.

Do not connect the battery packs in parallel configuration.

Never disassemble or modify the battery pack.

Do not use the battery pack with apparent external damage.

1-4. Safe Storage

Caution

To prevent accidents and damage, do not store the servo under the conditions listed below

- Location with temperatures above 60 degree celsius or below 20 degree celsius.
- Location with direct sunlight.
- Location with high humidity.
- Area with vibration.
- Dusty area.
- Area with possible electrostatic electricity,
- Area within easy reach of children.

2–2. Product Overview

Smart Servo

DRS-0101 and DRS-0201 are state of the art modular smart servos incorporating motor, gear reducer, control circutry and communications capability in one single package. Both servos are capable of detecting and responding to internal changes in termerature and voltage supply.

Simple Assembly and Wiring

Small, light, and easy to assemble structure. Ours sevos make joint assembly an easy job with an added advantage of simple wiring. Two connectors attached to each servo allows serial connection as well as parallel connection if required.

Highest Stall Torque in relation to Size and Power

In relation to size, weight, and power requirement, our servos have the highest stall torque in its class.

Versatility from Two Different Models

By introducing two different models of the same size but with different torque and speed, our customers have the choice to choose and mix and match the servos to assemble custom joints.

- DRS-0101: Stall Torque 12kgf,cm @7.4DCV [166.8 ozf,in.], Speed 0.166s/60°@7.4DCV
- DRS-0201: Stall Torque 24kgf,cm @7.4DCV [333.6 ozf,in.], Speed 0.147s/60°@7.4DCV

Smooth Movement

Once the servo receives a movement command, it automatically creates a trapezoidal type speed profile like the diagram below to control the position. With the servo operating according to the acceleration/deceleration profile, it suppresses vibrations caused by the sudden acceleration and deceleration as found in the square type speed profile and increases the energy efficiency while leading to smoother movement. The servo chooses the trapezoidal type speed profile as a default but profile could be changed according to usage to trapezoidal type, square type or triangle type.

Durability

Manufactured using Super Engineering Plastic, our servos are highly durable, impact resistant and designed to withstand even the high torque stress levels that go beyond the tolerance specs of Engineering Plastic Gears.

Communication

Using Multi Drop TTL Full Duplex UART Serial communications protocol with maxium speed of 0.667Mbps, single command can set the speed, position, LED, operational compliance, stop and operational status of up to 254 servos simultaneoulsy at once.

54 Operating Parameters

Operational parameters such as speed, calibration, compliance to external force, LED could be set by writing directly to the register, by using the Servo Manager downloaded from the web site or by using the Servo Manager Kit sold separately.

Resolution

0,325 degrees resolution provides very accurate smooth control and minimal vibration.

Maximum Operating Angle

- Position Control Mode: $0 \sim 320^\circ$ possible but recommended range is within $0 \sim 300^\circ$
- Speed Control Mode: Continuous rotation possible with rotation speed control

Compliance Control

By controlling the torque according to the discrepancy between the goal position and the actual position, Compliance Control provides certain measure of elasticity to absorb the shock from the external force.

Data Feedback

Data feedback from the internal temperature, position, and overload sensors.

Protection Features

- Internal temperature sensor monitors the motor and the circuit temperature and issues Overheating
 Protection Error if the temperature moves beyond set value.
- Overload Protection Error is issued when the load stress on the servo goes beyond the set value. These safety features protec the sevo from the potential damage and prolongs the servo life.

Self Diagnosis

Servos are capable of diagnosing seven different types of errors which are then indicated by the LED. Servo UI is used to set the function and timing of the Overload Protection.

(protects the servo when the overload occurs by releasing the torque)

Multi Drop Network

Expandable Multi Drop type Network with 1:n configuration. (single controller connected to multiple "n" number of servos).

Multi Function LED

User has direct control the three independently controlled LEDs Red/Green/Blue which are used for diagnostics and decorative purposes, LED commands are sent together with the Operation command.

* In case of an error, diagnostics function ignores all LED commands and the Red LED starts to blink periodically according to the setting.

Metal Ball Bearing (DRS-0201)

Ball bearing installed on the 4th gear shaft will prevent wear, sloping and provide protection from external shocks that can bend the shaft or throw the gear out of mesh.

** DRS-0101 : Plastic Bushing** DRS-0201 : Metal Ball Bearing

2-3. Specification

Dimension / Weight	45mm(W) x 24.0mm(D) x 31mm(H) / 45g [1.59 oz] 45mm(W) x 24.0mm(D) x 31mm(H) / 60g [2.12 oz] (DRS-0201) [1.77 in.(W) x 0.94 in.(D) x 1.22 in.(H)]
Reduction Ratio Gear Material	1:266 Super Engineering Plastic, Heavy Duty Metal (DRS-0201)
Input Voltage Rated Current Motor	7~12VDC(Optimized 7.4V) 450mA @ 7.4V: 1.7kgf.cm, 670mA @ 7.4V: 2.2kgf.cm (DRS-0201) Carbon Brush Cored DC, Metal Brush Coreless DC (DRS-0201)
Stall Torque / Maximum Speed	12kgf.cm [166.8 ozf.in.] / 0.166s/60 ° @7.4V 24kgf.cm [333.6 ozf.in.] / 0.147s/60 ° @7.4V (DRS-0201)
Resolution	0.325 °
Operating Angle Temperature	320 $^{\circ}$, Continuous Rotation 0 \sim 85 $^{\circ}$ [32 $^{\circ}$ F \sim 185 $^{\circ}$]
Communication Link ID, Maximum Baud Rate	Full Duplex Asynchronous Serial(TTL Level), Binary Packet, Multi Drop 0 \sim 253, 254(Broadcast only) 0.67Mbps
Feedback	Position, Speed, Temperature, Load, Voltage etc.
Control Algorithm	PID, Feedforward, Trapezoidal Velocity Profile, Velocity Override, Torque Saturator & Offset, Overload Protection, Neutral Calibration, Dead Zone 54 Selectable Setting Parameters(* Servo Manager Kit Required)

* Refer to Pages 51 and 52 for connector specs.

3-3. Connector Pin & System Assembly

All the Servo to Servo connectors have same Pin assingment as the diagram below. Multi Drop Network makes expansion easy.

Caution

Servos must be cross connected to the PC or Motion Controller, Examples of cross connection would be Servo TXD to PC or Motion Controller RXD, Servo RXD to PC or Motion Controller TXD.

Caution

Do not connect the servo directly to the PC without using the Motion Controller or Signal Converter. Even though both PC and the servo uses serial protocol (TXD, RXD) they are not directly compatible due to electrical difference.

If using custom made Wire Harness, make sure to check that connector pin assingments are in correct order. Servo LED will blink once if it is receiving power properly. If the LED does not blink, check the connector pin assignment and the power supply Voltage and Amp.

4. Operation

4-1. Communications Protocol

Introduction

Servo Controller communicates with the servos in the network by sending a Request Packet and receiving ACK Packet back from the servo. The example below shows the controller sending a Request Packet to the Servo n and receiving ACK packet back from the Servo n. Regardless of the number of servos in the network, only the servo with correct ID (n) will acknowledge the Request Packet and send the ACK Packet to the controller.

Communication Protocol

Data Bit: 8
Stop Bit: 1
Parity: None
Flow Control: None

Baud Rate: 57,600 / 115,200 / 0.2M / 0.25M / 0.4M / 0.5M / 0.667M

** The communications speed of the PC communication ports or USB to Serial Cable can be limited by the hardware or by the device driver. If problem occurs, check the Baud Rate of the involved port of peripheral to make sure it supports 115,200bps. If the supported Baud Rate can not found, set the Baud Rate to 115,200bps or 57,600bps and try again. The default factory setting for DRS-0101 and DRS-0201 is 115,200bps.

Packet

Type	Hea	ader	Packet Size	plD	CMD	Check Sum1	Check Sum2	Data[n]
Value	0xFF	0xFF	7~223	0~0xFE	1~9	Refer to Detail	Refer to Detail	Refer to Detail
Byte	1	1	1	1	1	1	1	MAX 216

▶ Header

Indicates start of the Packet.

Type	Hea	nder
Value	0xFF	0xFF
Byte	1	1

▶ Packet Size

Refers to total Packe size (in Bytes) from Header to Data. The maximum Packet Size 233, if the packet size is larger than 223 Bytes, packet may not be recognized. Minimum packet size is 7 which is packet without any data.

▶ pID

Unique pID value can range from 0 \sim 253 which is total number of servos in the network. Care must be taken when using pID value of "0xFE" which is a special value that affects all the servos in the network.

* To avoid confusion with Servo ID, ID within the packet is deonoted pID

Type	pID
Value	$0\sim 0$ xFE
Byte	1

► CMD

CMD is actual instructions for the servo to perfom when packet is received. There are 9 types of CMD in Request Packet EEP_WRITE(0x01), EEP_READ(0x02), RAM_WRITE(0x03), RAM_READ(0x04), I_JOG(0x05), S_JOG(0x06), STAT(0x07), ROLLBACK(0x08), REBOOT(0x09). ACK Packet also has equivalent set of CMD, but to distinguish from the Request CMD, ACK Packet adds 0x40. For example, ACK Packet CMD for Request Packet EEP_WRITE(0x01)would be 0x41.

Type	CMD
Value	0x01 \sim 0x09 : Request Packet 0x41 \sim 0x49 : ACK Packet
Byte	1

► Check Sum1

Check Sum1 is used to check for errors in the Packet. Check Sum1 is calculated as follows, Check Sum1 = (PacketSize ^ pID ^ CMD ^ Data[0] ^ Data[1] ^ ^ Data[n]) & 0xFE. Header, Check Sum1, Check Sum2 are not included in the calculation.

* 'A ^ B': Bit Exclusive OR Operator, A is different from B 1(True), same 0(False)

Type	Check Sum1
Value	(PacketSize ^ pID ^ CMD ^ Data[0] ^ Data[1] ^ ····· ^ Data[n])&0xFE
Byte	1

► Check Sum2

Checksum2 is also used to check for errors in the Packet, Check sum2 is calculated as follows, Check Sum2 = (\sim CheckSum1) & 0xFE

 $\times \sim$ A': Bit Not Operator, A = 0 1(True), A = 1 0(False)

Туре	Check Sum2					
Value	(~CheckSum1) & 0xFE					
Byte	1					

▶ Data[n]

Number of Data depends on CMD and some CMD may not have Data field. Refer to CMD for details.

Туре	Data
Value	Refer to CMD for details
Byte	Max216

4-2. Register Map

Register Map are values residing within the Servo and contain data pertaining to current servo status and operation. Registers are either Non-Volatile or Volatile.

Users are able to control the servos by using Request Packet and ACK Packet to either check or change the data in the Register Map.

Non-Volatile Register Map

Non-Volatile memory retains data without power. Once the power is turned on, data in the Non-Volataile memory in EEP Register are copied to the RAM Register which is Volatile memory. Data in the Non-Volatile memory does not have direct affect on the operation of the servo once it has been copied to the RAM Register. Rebooting the servo will again copy the data from EEP Register to the RAM Register.

▶ Address

Address refers to the address of the Register. To Read/Write to the Register, Register address must be included in the Packet.

▶ Default

Factory Default Value, Rollback Protocol is used to return all values to Factory Default Value.

▶ Valid Range

Range of valid data values servo can have. Input of data beyond the Valid Range will possibly result in unpredictable servo behavior.

► RO(Read Only), RW (Read Write)

RO refers to read only Registers. Writing to RO Register will result in error.

RO Registers hold fixed values such as Model #, Version or sensor values used for feedback. RW refers to Registers which be both read and written to.

e (Reg_Name): Refers to Reg_Name in EEP Register.

* r (Reg_Name) : Refers to Reg_Name in RAM Register.

ADDRESS	Type	Bytes	Default	Valid Range	RW	Description

^{** 2} Byte Variable Byte Order: (Little Endian) Most significant byte is stored int the higher address.
[Example]: e(Position Kp) Address is 30~31. To store 0x1234(4460), store the least significant first Address(30)= 0x34, and most significant digit last Address(31)=0x12

▶ Max, PMW, Dead Zone

- PWM is the value representing engergy input to the Servo. When the energy is increased, servo torque or speed increases.
- Max. PWM: Limits maximum PWM, In other words, limits the maximum energy supplied to the Servo. Energy use is optimized by limiting the maximum torque or speed of the servo.
- Dead Zone: Servo moves to reach the exact Goal Position. When the difference (Error) between the current position and the goal position becomes 0, the force drops to 0 and the servo stops.Dead Zone provides flexibility to the servo operation by increasing the range where the force drops to 0.If the difference (Error) is less than the Dead Zone, servo assumes it has reached the goal position and stops.
- * "What does operational flexibility" mean? In the graph below, green line is the PWM level without the Max. PWM and Dead Zone set. The yellow line is the PWM level with the Max.PWM and the Dead Zone set. The yellow line shows the PWM dropping to 0 within the Dead Zone even though Goal Position has not been reached. Looking at the right side of the graph, even though the green line is above (larger) than the Max.PWM, actual PWM value (yellow line) is within the Max.PWM.
- * Setting the Dead Zone too large will increase the discontinuous PWM section and lead to decreased controllability. Recommended Dead Zone value is below 10.

^{*} Intel & Alpha Processesors use Little Endian, whereas most of the RISC Processers & Mortorola Processors use Big Endian.

Volatile Register(RAM Register) MAP

Volatile Memory has direct affect on the operation of the Servo and reverts to default (EEP Register) value when the Servo is reboot even though RAM register value has been changed to change the servo operating parameters. Read/Write has to be performed to RAM Register value to operate the Servo, change the operating parameters or to check servo status.

ADDDECC	2 T	Didaa	Valid Dense	DW	Description

NO	Type	Bytes	EEP ADDR	RAM ADDR	RW	Description
48	LED Control	1	_	53	RW	Servo LED control • When corresponding Bit value 1 = On, 0 = Off (0x01: Green, 0x02: Blue, 0x04: Red) * When alarm LED activated by r(Status Error) and r(Alarm LED Policy). r(Led Control) Write value ignored
49	Voltage	1	_	54	RO	Input Voltage = 0.074 X ADC
50	Temperature	1	_	55	RO	Internal Servo Temperature
51	Current Control Mode	1	_	56	RO	Current time Servo control mode • I_JOG / S_JOG CMD Packet used to change control mode • When Torque On using r(Torque Control), Servo refers to r(Current Control Mode) 0 : Position Control 1 : Turn/Velocity Control
52	Tick	1	_	57	RO	• Servo operating time, Max setting 2,8672sec • 0 \sim 255, 1 = 11,2ms
53	Calibrated Position	2	-	56	RO	Calibrated position Raw Data Refer to r(Calibration Difference)
54	Absolute Position	2	_	58	RO	Absolute position Raw Data Angle = r(Absolute Position) X 0,325
55	Differential Position	2	_	60	RO	Shows speed measurement, interval 11,2ms r(Diff Position)1 = 29,09deg/sec
56	PWM	2	_	62	RO	Current Torque, 1023 = Max Torque
57	Reserved	2	_	64	_	Reserved
58	Absolute Goal Position	2	_	66	RO	Absolute Goal position Raw Data User selected Goal Position Uncalibrated value
59	Absolute Desired Trajectory Position	2	_	68	RO	Current Intermediate goal position based on velocity Profile, Raw Data r(Absolute Desired Trajectory Position) is current goal position
60	Desired Velocity	2	_	70	RO	Current intermediate goal speed based on velocity Profile, Raw Data r(Desired Velocity) velocity required at current time.

► Acceleration Ratio(RAM Register Address 8)

Acceleration Ratio is controlled by changing the parameter value and any change in the acceleration ratio is applied to the decceleration ratio by exactly the same amount. The default Acceleration Ratio parameter shows a trapezoidal type speed profile.

** Increasing the acceleration ratio will lead to sudden change in speed accompanied by vibration as shows in blue rectangle graph. Decreasing the ratio will show slow increase in speed with smooth movement as in green triangle graph.

► Maximum Acceleration Time(RAM Register Address 9)

Controls maximum acceleration time, 1 is equaivalent to 11.2ms.

Maximum acceleration time r(Maximum Acceleration Time) 254 is equivalent to 2.844sec.

* When r(Maximum Acceleration Time) is 0, velocity Profile is rectangle.

► Torque Control(RAM Register Address 52)

- Controls Torque eanable states
- 0x40 : Break On
- 0x60 : Torque On
- 0x00 : Torque Free
- When the torque is enabled, it's mode depends on "Current Control Mode". If the servo was on Position Control Mode when Torque ON is enabled, it will remain in that mode.
- * r(Current Control Mode) defaults to Position Control(0) when servo is first powered on
- * Control commands will only function when Torque On is enabled (I_JOG, S_JOG)
- * Control commands will not function when Break On is enabled (I_JOG, S_JOG)
- * Joints can be manually manipulated when Torque Free is enabled

► LED Control(RAM Address 53)

Controls the LEDs.

- When Bit value below is 1 = On, 0 = Off
- 0x01 : Green

• 0x02 : Blue

0x04 : Red

Whe Alarm LED is activated by the r(Status Error)or r(Alarm LED Policy), value in r(LED Control) is ignored.

► Voltage(RAM Register Address 54)

Shows the ADC(Analog Digital Conversion) value of the input voltage in raw data. The conversion formula to actual voltage is shown below. Refer to the voltage ADC conversion table in page 49. Voltage = 0,074 X ADC

► Temperature(RAM Register Address 55)

Shows the ADC(Analog Digital Conversion) value of the current temperature in raw data. Refer to temperature ADC conversion table in page 51.

► Current Control Mode(RAM Register Address 56)

Shows the current control mode of the servo, I_JOG / S_JOG CMD Packet is used to change the mode.

- When r(Torque Control) is used to change the servo state to Torque On, servo first refers to r(Current Control Mode). For example, dafault mode of the servo when it is first powered up is "Position Control Mode" and when the servo state is changed to Torque On, mode remains at "Position Control Mode". Servo has to be at Off state to change the control mode to "Turn/Velocity Control Mode". With Torque Off, use I_JOG / S_JOG CMD to switch to "Turn/Velocity Control Mode". After the switch, use r(Torque Control) to to turn Torque On and the mode will have switched to "Turn/Velocity Control Mode".
- 0 : Position Control
- 1: Turn / Velocity Control
- ** Turn / Velocity Control: Infinite Turn(Continuous Rotation) Mode.

▶ Tick(RAM Register Address 57)

Shows actual length of the servo tick time. Tick time can be changed from $0\sim255$, tick time reverts back to 0 after 255. 1 is equivalent to 11.2ms, 255 is equivalent to 2.856sec.

Calibrated Position(RAM Register Address 58)

Shows Calibrated Position in raw data, The relationship between Calibrated Position and Absolute Position is as follows,

- Calibrated Position = Absolute Position r(Calibration Difference, 47 Address)
- Degree = Position Raw Data X 0,325

► Absolute Position(RAM Register Address 60)

Shows uncalibrated current position in raw data, Relationshop between Raw Data and actual degree is as follows.

Degree = Position Raw Data X 0,325

▶ Diff Position(RAM Register Address 60)

Shows velocity measurement, velocity is measured in 11.2ms intervals.

 \times r(Diff Position) 1 = 29.09deg/sec

► PWM(RAM Register Address 62)

Shows current Torque in raw data, maximum value is 1023.

► Absolute Goal Position(RAM Register Address 66)

Shows uncalibrated goal position in raw data.

► Absolute Desired Trajectory Position(RAM Register Address 68)

• Uncalibrated current goal position in Raw Data. To arrive at user designated absolute goal position, servo automatically plans out the trajectory to the goal position using the velocity profile. Absolute Desired Trajectory Position is a "current" goal position or intermediate goal position to be reached on the way to final goal position.

Refer to the diagram to see the relationship between Absolute Goal Position and the Absolute Desired Trajectory Position.

► ACK Policy(RAM Register Address 1)

Sets ACK Packet reply policy when Request Packet is received.

- 0 : No reply to any Request Packet
- 1: Only reply to Read CMD
- 2: Reply to all Request Packet
- * When the CMD is "STAT" ACK Packet will be sent regardless of r(ACK Policy).
- ** There is no reply when the pID in Request Packet is 254(Broadcast pID) with an exception of "STAT" CMD in which case reply will be sent.

Alarm LED Policy(RAM Register Address 2)

Sets Alarm LED policy when Error is detected.

- When (r(LED Policy) & r(Status Error)) is TRUE, Alarm LED starts to blink, Alarm LED blink period is set by r(LED Blink Period).
- When (r(LED Policy) & r(Status Error))is TRUE, Any values written to r(LED Control) will be ignored to prevent confusion with Error state.
- Error status r(Status Error) must be resloved first for r(LED Control) to function properly.
- * 'A&B': Bit And Operator, 1(True) only whe A and B are both (True)

► Torque Policy(RAM Register Address 3)

Sets Torque Off policy when Error is detected.

When (r(Servo Policy) & r(Status Error))is TRUE, Torque is released (Torque Off). Under the Error condition, servo will not return to Torque ON state regardless of the value written to r(Torque Control).

33

- Servo does not automatically revert to Torque On state even after r(Status Error)has been resolved. Enable Torque On using r(Torque Control) after r(Status Error) has been resloved.
- * 'A&B': Bit And Operator, 1(True) only whe A and B are both (True)

► Maximum Temperature(RAM Register Address 5)

Maximum operational temperature shown in Raw Data,

- When internal servo temperature r(Temperature) exceeds r(Max Temperature), "Exceeded Temperature Limit" in r(Status Error) becomes active.
- Resulting Alarm LED and Torque status can be changed using r(LED Policy), r(Servo Policy).
- Default value is 0xDF(approximatley 85°C). Refer to conversion chart (Pg 51) for actual temerature.
- * 'A&B': 1(True) only whe A and B are both (True)

Minimum Voltage(RAM Register Address 6)

Mininmum input voltage shown in Raw Data.

- When servo input voltage r(Voltage) is below r(Min Voltage), "Exceeded Voltage Limit" in r(Status Error) becomes active. Resulting Alarm LED and Torque status can be changed using r(LED Policy), r(Servo Policy).
- Default value is 0x5B(approximately 6.74V). Refer to conversion chart (Pg 49) for actual voltage.

► Maximum Voltage(RAM Register의 Address 7)

Maximum input voltage shown in Raw Data.

- When servo input voltage r(Voltage) is exceeds r(Max Voltage), "Exceeded Voltage Limit" in r(Status Error) becomes active. Resulting Alarm LED and Torque status can be changed using r(LED Policy), r(Servo Policy).
- Default value is 0x89(approximately 10,14V). Refer to conversion chart (Pg 49) for actual voltage.

Overload PWM Threshold(RAM Register Address 18)

Sets overload activation point. The overload point from external force can set from 0~1023.

- Overload activates when external force is greater them r(Overload PWM Threshold).
- Overload does not activate when the given value is greater than 1023

▶ Minimum Position(RAM Register Address 20)

Minimum operational angle in Raw Data,

- When requested position angle is less than r(Min Position), "Exceed Allowed POT Limit" in r(Min Position) becomes active and the operation is limited to r(Min Position).
- Default value is 0x15(approximately -159.8°). Refer to conversi on charge in (Pg 53) for actual angle.

► Maximum Position(RAM Register Address 22)

Maximum operational angle in Raw Data.

- When requested position angle is greater than r(Max Position), "Exceed Allowed POT Limit" in r(Max Position) becomes active and the operation is limited to r(Max Position).
- Default value is 0x3EA(approximately 159,8°). Refer to conversion chart in (Pg 53) for actual angle.

▶ Position Kp(RAM Register Address 24)

Shows the Proportional Gain. Increasing the Position Kp increases, the response time but over response (vibration, overshoot) will result if the increase is too large.

▶ Position Kd(RAM Register Address 26)

Shows the Derivative Gain. Increasing the Position Kd will suppress the over response (vibration, overshoot) from Position Kp but unstability may result if the increase is too large.

▶ Position Ki(RAM Register Address 28)

Shows the Intergral Gain. Applied to correct small offset in Steady State. May result in response lag if the increase is too large.

▶ Position Feedforward Kd(RAM Register Address 30)

Shows Position Feedforward 1st Gain, Applied to increase Servo response time,

▶ Position Feedforward Kdd(RAM Register Address 32)

Shows Position Feedforward 2nd Gain, applied to increase Servo response time,

► LED Blink Period(RAM Register Address 38)

Shows the Alarm LED blink period set by the LED Policy when error occurs, 1 is equivalent to 11,2ms, Default value is 0x2D(Approximately 504ms).

▶ ADC Fault Check Period(RAM Register Address 39)

Temperature / Input voltage error check interval, 1 is equivalent to 11,2ms. Error activated if the Temerature / Input voltage error lasts longer than the check interval.

Default value is 0x2D(Approximately 504ms).

▶ Packet Garbage Check Period(RAM Register Address 40)

Incomplete Packet error check interval, 1 is equivalent to 11,2ms. Incomplete Packet is deleted if it remains longer than the check interval. Default value is 0x12(Approximately 201ms)

► Stop Detection Period(RAM Register Address 41)

Set time limit by which the servo stoppage is measured to determine if it has stopped, 1 is equivalent to 11,ms. If the servo stoppage lasts beyond the time limit, it is determined to be stopped. Default value is 0x1B (Approximately 302ms)

Overload Detection Period(RAM Register Address 42)

Set time limit by which the servo overload is measured to determine if the overload has occured. If the overload period lasts beyond the time limit, it is determined to be overloaded. Default value is 0x96 (Approximately 1,68s)

▶ Stop Threshold(RAM Register Address 43)

The servo is seen as not moving (stopped) when the position movement of the servo is less than the r(Stop Threshold). The servo is determined to be stopped if the stoppage lasts longer than the r(Stop Detection Period).

▶ Inposition Margin(RAM Register Address 44)

Standard value to determine if the goal position has been reached.

Goal position is judged to have been reached if the deviation is less than r(Inposition Margin).

► Saturator Offset, Saturator Slope(RAM Register Address 11, 12)

Saturation Offset and Saturation Slope work in similar manner to the PWM. However, by controlling the limit per given section, accurate Saturator can be designed to provide flexible and elastic response to the external force. The garph below shows the PWM with several settings. The thick grey line show the PWM without the Saturator Offset and Slope settings. The red line shows the actual PWM output with the Saturator Offset & Slope set. The blue dotted line shows the boundary of the force restrained by the Saturator. The restrain by the Saturator on PWM value increases when near the goal position and decreases when further away from the goal position. The effect on PWM is smiliar to having a spring installed near the goal position, resulting in low strength near the goal position and strength increasing with distance. Assuming the servo is stopped at the goal position, Saturator allows flexible response to external force, and provides assistance when trying to hold delicate object.

► PWM Offset(RAM Address 14)

When the 0 point of the PWM is moved, PWM will increase output by the amount of the Offset. This output could be used to act as a compensator in a system where load is on one side (Ex: Gravity). By moving the 0 point, constant force directed towards 0 pont can applied.

► Minimum PWM(RAM Register Address 15)

PWM output value does not fall below the r(Min, PWM). Minimum PWM is used when there is jerky movement due to tight fitting or friction in the servo application system but assigning Minimum PWM that is too large may lead to unstable system.

► Maximum PWM(RAM Register Address 16)

PWM output value does not exceed r(Max, PWM). Battery life could be increased by limiting the Maximum PWM but it will also decrease the maximum servo torque.

▶ Relationship between Saturator & PWM

PWM results in servo output. As seen in the graph below, there are several parameters controlling the servo output. These parameters can be manipulated to build optimum servo system. To see the characteristics of each parameter, refer to the detailed explanation section in the manual.

► Calibration Difference(RAM Register Address 47)

Used to calibrate newtral point(standard). Used to make adjustments to compensate for assembly variations when servos are used to build a system. Calibrated Difference is calculated by following formula

Calibrated Position= Absolute Position – Calibration Difference

Status

REG (Status Error)

Bits 7 6 5 4 3 2 1 0

Bits	Value	Comment
0	0X01	Exceed Input Voltage limit
1	0X02	Exceed allowed POT limit
2	0X04	Exceed Temperature limit
3	0X08	Invalid Packet
4	0X10	Overload detected
5	0X20	Driver fault detected
6	0X40	EEP REG distorted
7	0X80	reserved

Ж	LED	Policy.	Servo	Policy:	Same	as	above

- ** LED Policy: When Check bit error occurs, LED(RED) blinks consistently
- ※ Servo Policy: When Check bit error occurs, Torque is released to Freerun state

REG (Status Error)								
7	6	5	4	3	2	1	\cap	

Bits	Value	Comment
0	0X01	Moving flag
1	0X02	Inposition flag
2	0X04	Checksum Error
3	0X08	Unknown Command
4	0X10	Exceed REG range
5	0X20	Garbage detected
6	0X40	MOTOR_ON flag
7	0X80	reserved

- When Invalid Packet occurs, detailed information is record in Status Detail Register
- ** Moving/Inposition/MOTOR_ON flag are Read only.
- * MOTOR_ON : Torque ON
- Yellow lines above points to error detail when Status Error shows Invalid Packet(0x08).
- Invalid Packet can be divided into 5 different causes, 4 shows in the Status Detail and other.
- Portions of Status Detail are Read only but can be Written to by the Protocol.
 Read only values are just ignored not actually Written to.

5. Command Set

To control the Servo, CMD is sent to the servo from the Controller in Binary format. Our servos are controlled by 9 different CMDs. Once the Servo receives Request Packet with included CMD, Servo performs requested operation and returns the result to the Controller by ACK Packet.

5-1. [To Servo Module] - Request Packet

Type	CMD	Explanation
EEP_WRITE	0x01	Write Length number of values to EEP Register Address
EEP_READ	0x02	Request Length number of values from EEP Register AddressMay not reply, depending on r(ACK Policy)
RAM_WRITE	0x03	Write Length number of values to RAM Register Address
RAM_READ	0x04	Request Lenght number of values from RAM Register AddressMay not reply, depending on r(ACK Policy)
I_JOG	0x05	 Able to send JOG command to maximum 43 servos. I_JOG can set the operation timing of individual Servo I_JOG Refer to Pg 48 for details
S_JOG	0x06	 Able to send JOG command to maximum 53 servos. S_JOG All the Servos operate simultaneously at same time S_JOG Refer to Pg 48 for details
STAT	0x07	Status Error, Status Detail requestAlways send reply reagardless of r(ACK Policy)
ROLLBACK	0x08	 Change all EEP Regsters to Factory Default value Apply changes after power reset ID, and Baud Rate maybe exempt from Factory Default depending on ID Skip and Baud Skip setting.
REBOOT	0x09	Request Reboot

5-2. [To Controller(ACK)] - ACK Packet

Type	CMD	Meaning
EEP_WRITE	0x41	CMD(0x01) Reply PacketDefault is no reply, Reply possible by changing r(ACK Policy) setting
EEP_READ	0x42	Repy with "n" number of values from EEP Register AddressMay not reply depending on r(ACK Policy) setting

Type	CMD	Explanation
RAM_WRITE	0x43	CMD(0x03) Reply PacketDefault is no reply, reply possible by changing r(ACK Policy) setting
RAM_READ	0x44	CMD(0x04) Reply PacketMay not reply depending on r(ACK Policy) setting.
I_JOG	0x45	CMD(0x05) Reply PacketDefault is no reply, reply possible by changing r(ACK Policy) setting
S_JOG	0x46	CMD(0x06) Reply PacketDefault is no reply, reply possible by changing r(ACK Policy) setting
STAT	0x47	r(Status Error, Status Detail) Reply, Always Reply regadless of r(Ack Policy)
ROLLBACK	0x48	CMD(0x08) Reply PacketDefault is no reply, reply possible by changing r(ACK Policy) setting
REBOOT	0x49	CMD(0x09) Reply PacketDefault is no reply, reply possible by changing r(ACK Policy) setting

^{*} ACK option changeable by using r(ACK Policy)

5-3. CMD(Command) Detailed Explanation

CMD	Explanation
EEP_READ	Request to read Length # of values from EEG Register AddressOptional Data length is 2
RAM_READ	 Request to read Length # of values from RAM Register Address Optional Data length is 2
EEP_WRITE	 Request to write Length # of values to EEG Register Address Optional Data length is Address & Length 1 Byte each + Length Byte
RAM_WRITE	 Request to write Length # of values to RAM Register Address Optional Data length is Address & Length 1 Byte each + Length Byte
I_JOG	 Send instructions to multiple servos simultaneously, able to set position/time to each servo independently. Able to set goal position time arrival time to each independently I_Jog requires 5Bytes of data for each servo. Optional Data length of 50Bytes required if sending instructions to 10 servos simultaneously
S_JOG	 Able to send instructions to multiple servos simultaneousy, All servos have same operational timing. All servos arrive at goal position at same time. S_Jog rquires 1byte for Playtime and 4Bytes for each servo. Optional Data length of 41Bytes required if sending instructions to 10 servos simultaneously
STAT	Request Servo Status r(Status Error, Status Detail) STAT Packet always receive reply
ROLLBACK	Change all values in EEP_Register to Factory default value,ID and Baud Rate maybe exempted from Factory Default by using ID Skip, Baud Skip Byte
REBOOT	Reboot Servo

^{**} ACK Packet CMD is Request Packet CMD + 0x40

^{*} Last 2 Bytes of the ACK Packet includes r(Status Error, Status Detail)

6. Command Examples

5-1. EEP_READ

Request 4 Bytes of information from EEP Register 0x1E Address of Servo ID(253), 4 Bytes from EEP Register 0x1E Address are e(Position Kp)and e(Position Kd).

	Hea	der	Packet Size	plD	CMD
EEP_READ	0	1	2	3	4
	0xFF	0xFF	9	Servo ID	0x02
Example1	0xFF	0xFF	0x09(9)	0xFD	0x02
	Check	Sum1	Check Sum2	Da	ata
EEP_READ		5	6	7	8
	(Refer to Check	ksum formula)	Data[0] (Address)	Data[1] (Length)
Example1	0XEC		0X12	0x1E	0x04

EEP READ

Request to read Length # of values from EEP Register Address. Data length is 2Bytes (Address 1Byte + Length 1Byte)

Packet Size	plD	EEP READ CMD
7(Standad Size)+2(Data length)	Servo ID 0xFD(253)	0x02 (Refer to Pg 40)

CHECKSUM1 Formula

DATA[0]

Refers to starting address of EEP Register being Read, 0x1E(30) in the example is starting address of Position Kp.

DATA[1]

Data[1], Refers to number of Bytes to be READ from the starting address, 0x04 in the example means 4Bytes will be read. In other words, 4Bytes from Position Kp starting address will be read, Position Kp(2Bytes variable) and Position Kd(2Bytes variable) will be read.

ACK Packet

EEP READ	Hea	der	Packet Size	plD	CMD	Check Sum1	Check Sum2
	0	1	2	3	4	5	6
ACK of Example1	0xFF	0xFF	0x0F	0xFD	0x42	0x4C	0xB2
	Data						
7	8	9	10	11	1	2 13	14
Data[0] (Address)	Data[1] (Length)	Data[2]	Data[3]	Data[4]	Dat	Data[4] (Status Erro	Data[5] r) (Status Detail)
0x1E	0x04	0xB8	0x01	0x40	0)	(1F 0x00	0x00

CMD: Request Packet CMD(0x02) + 0x40, Reply with 0x42

e(Position Kp): 440(0x1B8)Position Kd: 8000(0x1F40)

Last 2Bytes of all ACK Packet contain Status Error(1Byte) and Status Detail (1Byte)

6-2. EEP_WRITE

ID(253), e(Position Kp) / Kd(Address 0x1E=30, 4Bytes Register) Kp = 200(0x00C8), Kd = 1000(0x03E8) Write

	Head	ler	Packet Size	plD	CMD	Check Sum1	Check Sum2
EEP_WRITE	0	1	2	3	4	5	6
	0xFF (0xFF	7+(2+Length)	Servo ID	0x01	(Refer to Chec	ksum Formula)
Example1	0xFF (0xFF	0x0D(13)	0xFD	0x01	0XC8	0X36
	Data						
7	8		9	11		12	13
Data[0] (Address)	Data[(Lengt		Data[2]	Data	[3]	Data[4]	Data[5]
0x1E	0x04	4	0XC8	0X0	0	0XE8	0X03

Data[2] ~ Data[5]

Data[2], Data[3] will be changed to e(Position Kp) and Data[4], Data[5] will be changed to e(Position Kp). You must input Byte in reverse order by Little Endian rule.

* Refer to Pages 23 for Little Endian.

EEP Register

To apply changed EEP Register value, Servo has to be reboot first.

6-3. RAM_WRITE

Example 1

ID(253), r(LED Control), Address(0x35(53)) Request Green LED On.

Example 2

ID(253), r(Status Error, Status Detail), Request to Clear Address(0x30(48)) to "0".

Example 3

ID(253), r(Torque Control), Request to write 0x60 to Address(0x34(52)) for Torque On.

* Make sure to haveTorque On before (I_JOG, S_JOG) command to avoid error.

	Hea	ader	Packet Size	plD	CMD	Check Sum1	Check Sum2
RAM_WRITE	0	1	2	3	4	5	6
	0xFF	0xFF	7+(2+Length)	Servo ID	0x03	(Refer to Chec	ksum Formula)
Example1	0xFF	0xFF	0x0A(10)	0xFD	0x03	0xC0	0x3E
Example2	0xFF	0xFF	0x0B(11)	0xFD	0x03	0xC6	0x38
Example3	0xFF	0xFF	0x0A(10)	0xFD	0x03	0xA0	0x5E

Optional Data							
7	8	9	10				
Data[0] (Address)	Data[1] (Length)	Data[2]	Data[3]				
0x35	0x01	0x01	_				
0x30	0x02	0x00	0x00				
0x34	0x01	0x60	_				

6-4. RAM_READ

Example 1

ID(253), Read 1 Byte from Address 0x35(53), Addressed Register is r(LED Control)

44

RAM_READ ACK

Reply to RAM_READ(CMD 0x04)with Packet, reply CMD is 0x44, last 2Bytes of All ACK Packet contain r(Status Error) and r(Status Detail). ACK Packet reply option can be changed by r(ACK Policy)

Data[2]

0x01 is r(LED Control) value, it means Green LED is on.

Data[3]

Data[3] is Status Error: No Error, Data[4] 0x42 means Torque On and Inposition, Arrived at goal position.

	Header	Packet Size	plD	CMD	Check Sum1	Check Sum2
RAM_READ	0 1	2	3	4	5	6
	0xFF 0xF	F 7+(2+Length)	Servo ID	0x03	(Refer to Chec	ksum Formula)
Example1	0xFF 0xF	F 0x09(9)	0xFD	0x04	0xC4	0x3A
RAM_READ ACK	0xFF 0xF	F 0x0C(12)	0xFD	0x44	0xC2	0x3C
		Optional	Data			
7	8	9	10		11	
Data[0] (Address)	Data[1] (Length)	Data[2]	Data	[3]	Data[4]	_
0x35	0x01	_	_		_	_
0x35	0x01	0x01	0x0	0	0x42	_

6-5. I_JOG

Example 1

ID(253), Position Control, Position Goal 512, Green LED On, Operating Time(60:672ms)

Example 2

ID(253), Continuous Rotation, Goal Speed 320, Blue LED On, Operating Time(60: 672ms)

	Header	Packet Size	pID	CMD	Check Sum1	Check Sum2	
I_JOG	0 1	2	3	4	5	6	
	0xFF 0xFF	7+(5XI_JOG)	Servo ID	0x05	(Refer to Chec	ksum Formula)	
Example1	0xFF 0xFF	0x0C(12)	0xFD	0x05	0x32	0xCC	
Example2	0xFF 0xFF	0x0C(12)	0xFD	0x05	0x7E	0x80	
	Optional Data						
7	8	9	10		11		
		I_JOG_S	(0)				
JOG(LSB)	JOG(MSB)	SET	ID		playtime	_	
0x00	0x02	0x04	0xFC)	0x3C	_	
40	0x01	0x0A	0x0A	A	0x3C		

- Refer to Packet structure below for explanation of each Bit in I_JOG
- Able to use Structure as below for convenience
- LSB(Least Significant Bit) first for Bit value
- Example1 SET(0x04) is Position Control, Green LED On

```
typedef struct
        int
                                  iJogData
                                                            : 15;
        unsigned int
                                  uiReserved1
                                                            : 1;
                                  uiStop
                                                            : 1;
        unsigned int
        unsigned int
                                  uiMode
                                                           : 1; //0 : Position Control
                                  uiLED
                                                           : 3; //Green, Blue, Red
        unsigned int
                                  uiJoglnvalid
                                                           : 1;
        unsigned int
        unsigned int
                                  uiReserved2
                                                            : 2;
        unsigned int
                                  uclD
                                                            : 8;
        unsigned char ucJogTime_ms;
} IJOG_TAG
```

** Bit Variable size or bit field may vary depending on the compiler or compiler setting, The above example uses 16 bit variable. The structure byte alignment of the process may vary as well. The above example uses 1byte alignment as standard.

6-6. S_JOG

Example 1

ID(253), Position Control, Goal Position 512, Red LED On, Operating Time(60: 672ms)

Example 2

ID(253), Continuous Rotation, Goal Speed 704, Blue LED On, Operating Time(60: 672ms)

Reference

2.00mm (0.079") PITCH CONNECTOR

Wire-to-Board	
Wafer	

YW200 Series

+ + + + + + + + + + + + + + + + + + + 	
20 (ATCH) 20 6 C	36
	28

Material

I/NO	DESCRIPTION	TITLE	MATERIAL
1	WAFER	YW200	PA66, UL 94V Grade
2	PIN		Brass, Tin plated

Available Pin

PARTS NO.	A	В	С
YW200-02	5.9	5.1	2.0
YW200-03	7.9	7.1	4.0

YW200-13	27.9	27.1	24.0
YW200-14	29.9	29.1	26.0
YW200-15	31.9	31.1	28.0

Specification

ITEM	SPEC
Voltage Rating	AC/DC 125V
Current Rating	AC/DC 3A
Operating Temperature	-25°C~+85°C
Contact Resistance	30mΩ MAX
Withstanding Voltage	AC1000V/1min
Insulation Resistance	1000MΩ MIN
Applicable Wire	-
Applicable P.C.B	1.2~1.6mm
Applicable FPC/FFC	-
Solder Height	-
Crimp Tensile Strength	-
UL FILE NO	E108706

2.00mm (0.079") PITCH CONNECTOR
