

HMC-20

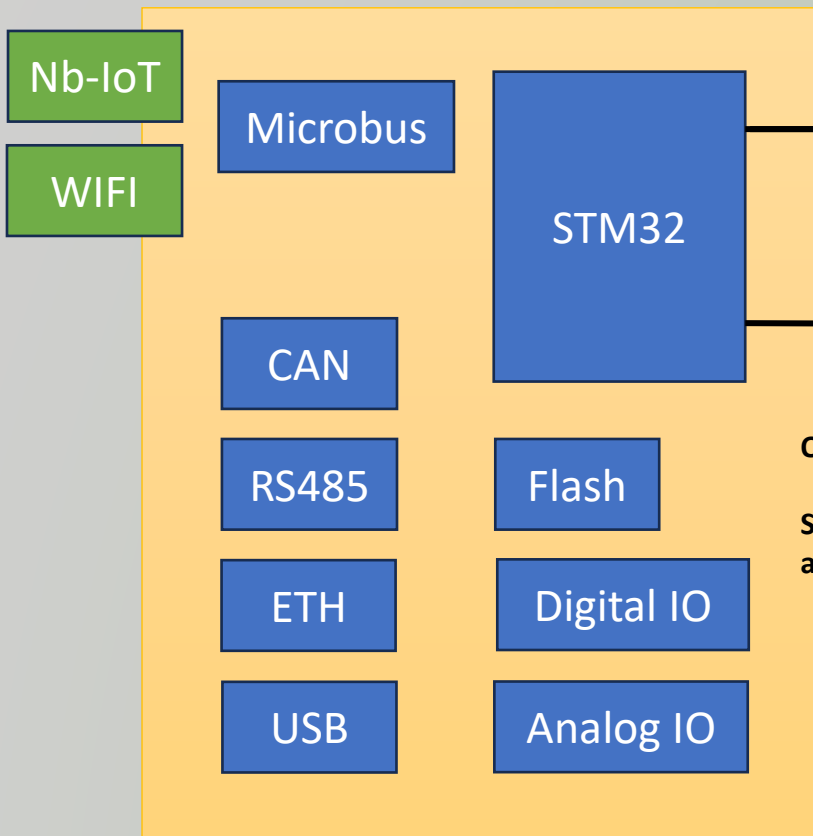

Human Machine Controller

Configurable HMI interface

Version date 22/01/2025

UAB-23

- Developed by customer with specific interfacing
- Generic board delivered by Saleconix

SD card access

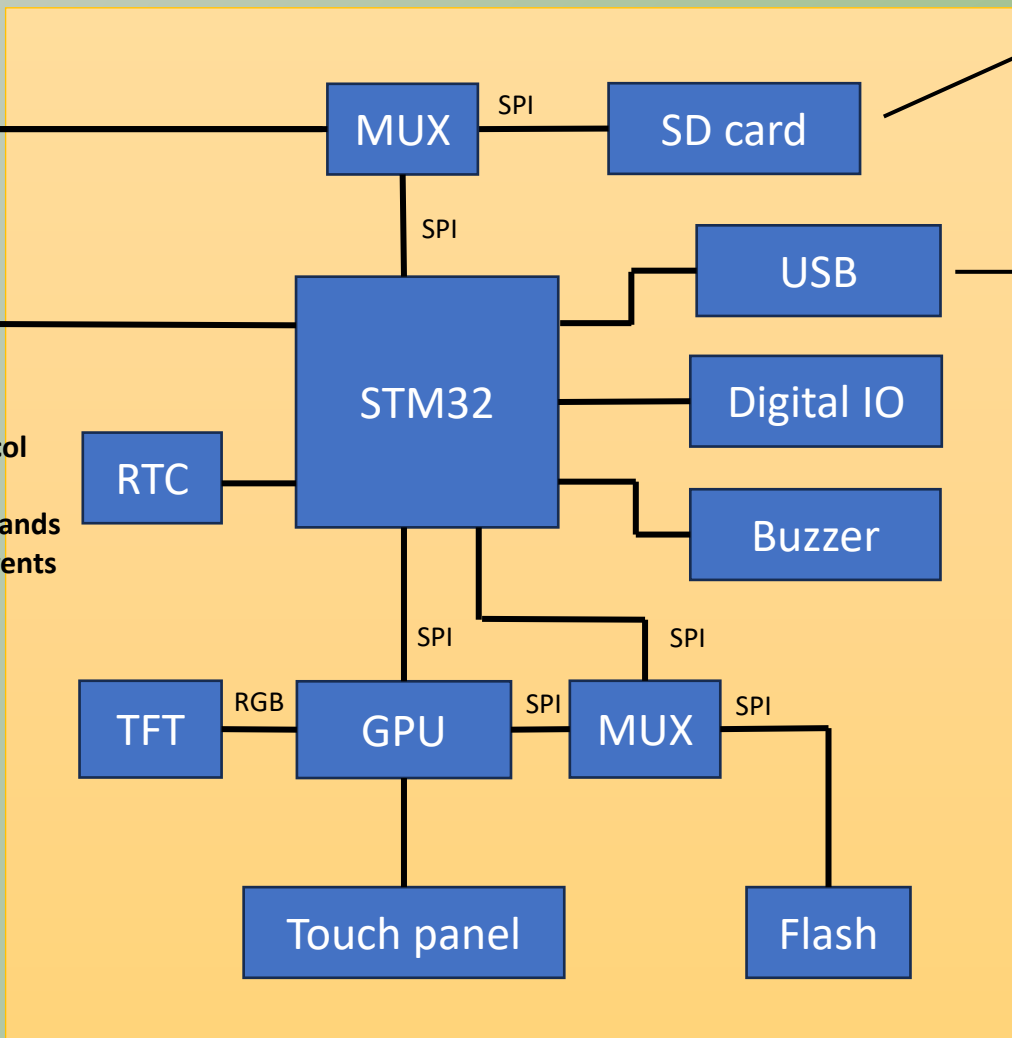

SPI

UART

Open protocol

Same commands as widget events

HMC-20

Contains

- BMP/JPG (widgets)
- GUI layout and interactions
- Extra fonts
- firmware update
- logging

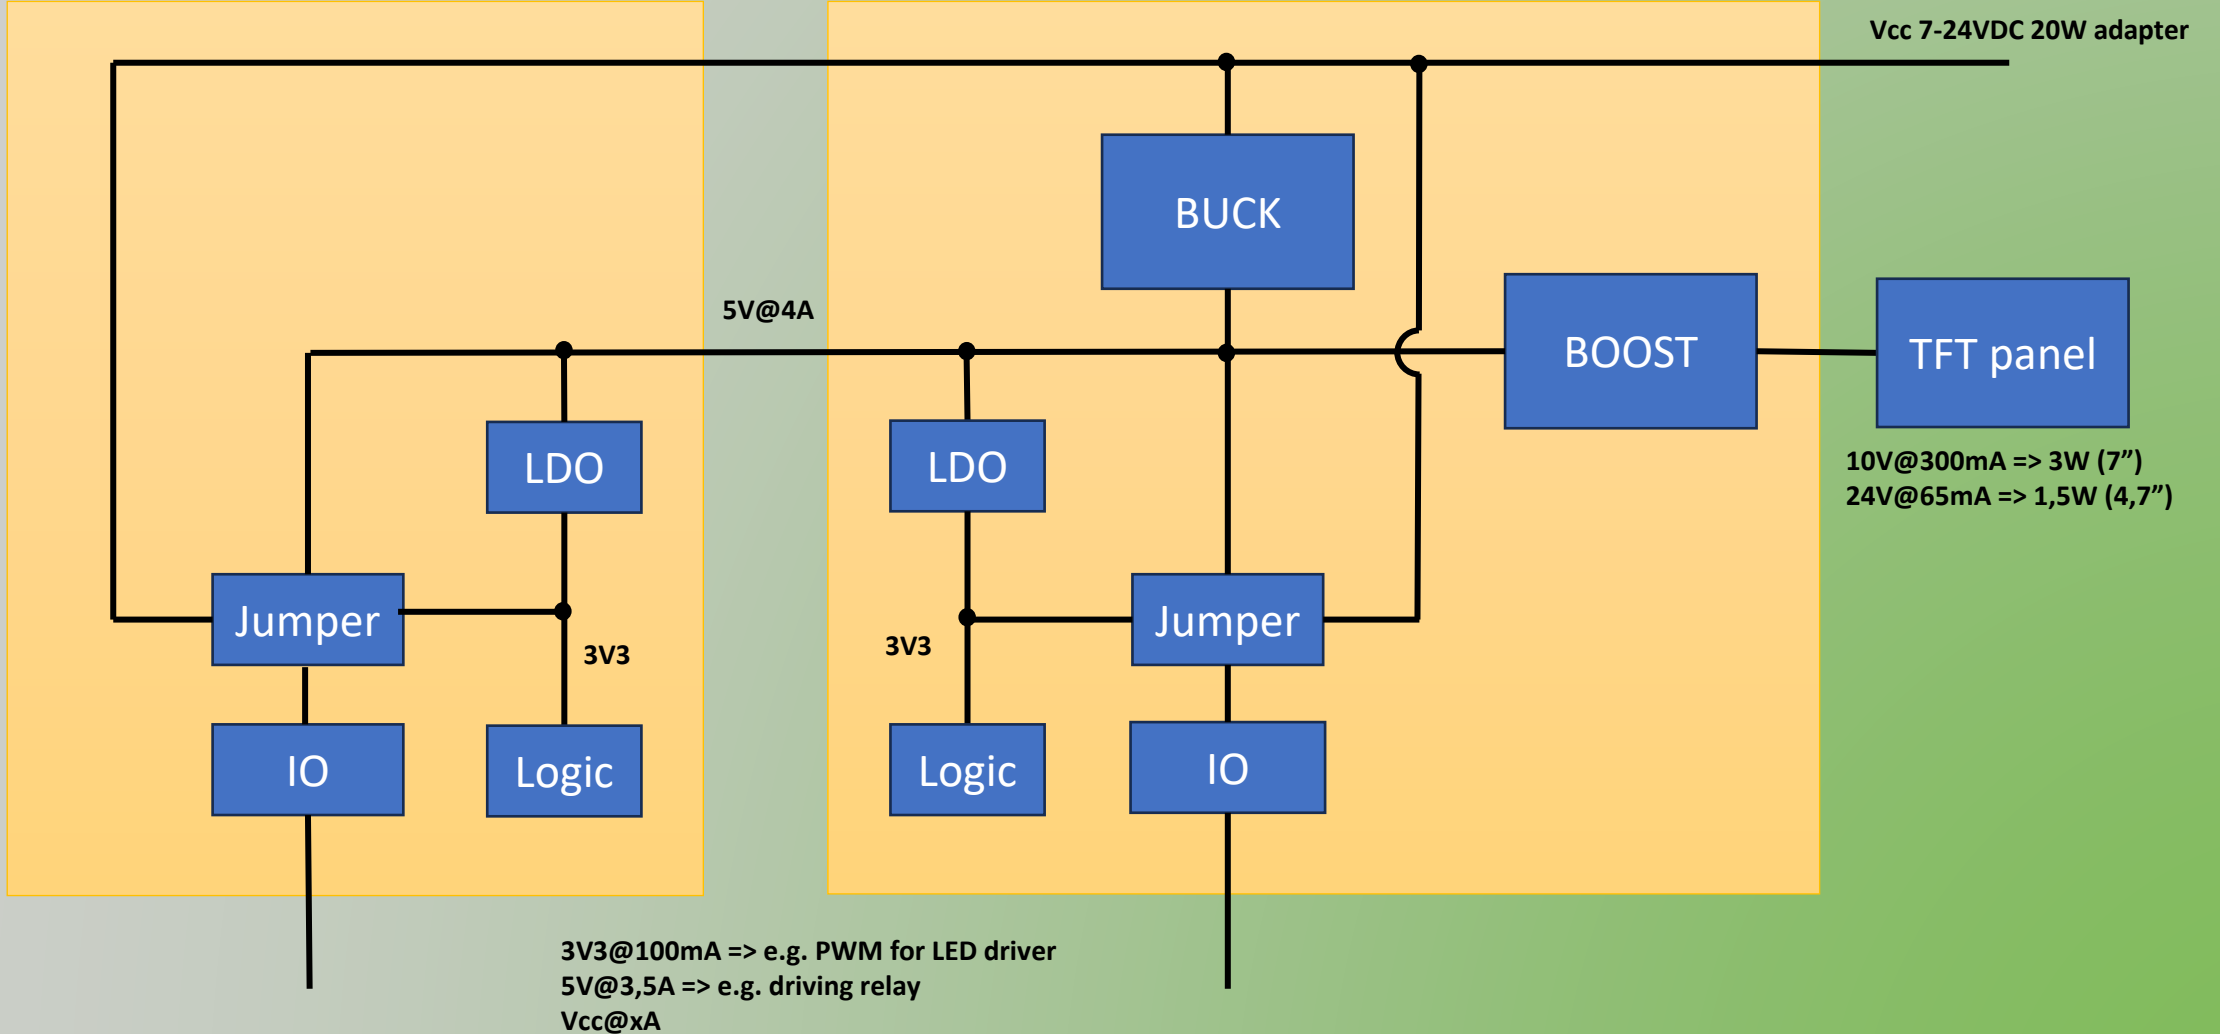

After connection:

- SD card available as drive
- UART as debug interface
- Firmware updates

HMC-20 can also be used autonomously (e.g. driving LED/relay)

UAB-23

HMC-20

Capacitive versus resistive TFT

HMC-20

Casing

Main features HMC-20

7" or 3,4" RGB TN TFT display

24bit 800x480px 1000 cd/m²

4x5 keypad interface

PWM backlight 10V/300mA

10 digital I/O

GPU 256/65K colors

Internal font ROM 8x16dots

RTC with external low power Xtal

Real time command interpreter

Rotation function 90° step

Internal widgets

SD-card interface

USB2.0 port ESD protected

Font ROM chip 150 countries

64Mb serial NOR flash with HMAC

Piezo electric buzzer

Resistive or capacitive touch interface

3V battery holder for RTC

User application board connector

High efficiency power supply

Demo code

```
Menu
----
s: Settings menu
i: Info menu
h: Help menu
1: Clear full memory
2: Clear data for all applications
3: Dump current layout to json
4: Load application from memory
5: Store application from SD card
6: Set clock
7: Firmware update
```

Updating widgets and layout

- 1:** SD card contains folders with images and “application.json” for each app
- 2:** Selected app will be copied to internal memory together with shared images
- 3:** Uploaded app can be selected in menu and is saved
- 4:** Last selected app is loaded after power on

SD card is no longer necessary as long as no layout changes are needed

Advantages:

- Fast access with internal flash
- SD card can be omitted when updating is not necessary
- SD card can be re-used for different modules
- Different apps contain layout variations for demo and evaluation purposes

Firmware update

- 1:** SD card contains signed and encrypted bin file
- 2:** By selecting the firmware update, the new image is copied in the external flash, verified and swapped
- 3:** Device will reboot and update is loaded

Widgets and attributes

Category	Widget	ID	Property	Behavior	Event
Visible	Page	Name	Background Image Color Location Size ...	Active Border (type/color) Sound (type/onoff) Visibility Coordinate system ...	Touch: press, release, up, down, left, right
	Button				
	Textual				
	Progressbar				
	Led				
Non visible	Timerblock		Time	Start, Stop	Run out
	Pincode			Command (eval/save)	Pass, Fail Saved succesfull
	Function			Execute	Execute

All attributes and properties can be changed by commands
 Coordinate system: center - corner
 Page: silent update mode → render after modifying widgets

Real time interpreter example

Performs predefined actions in a random order. Can be as widget events or sent by serial port. There are three predefined forms:

Property assign type A: `[pagename].[widget].[propname]=[property]`

Property assign type B: `[pagename].[propname]=[property]`

Command type: `[command] [argument]`

Example:

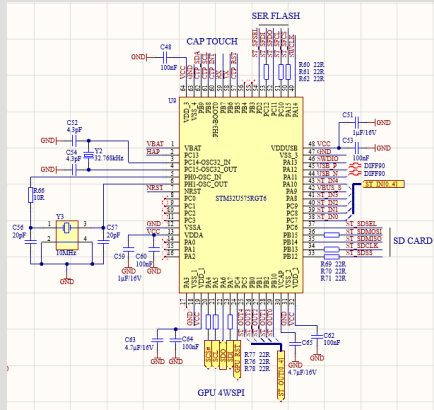

```
okbutton.setTouchPressEvent(  
    "code.unlockkeypad.cmd='exe'\n" // Unlock the keypad  
    "code.enter.act=true\n"        // Unlock the enter button  
    "code.crosshome.act=true\n"    // Unlock the cross home button  
    "code.ok.vis=false\n"          // Make the text 'ok' invisible  
    "code.pincodesaved.vis=false\n" // Make the text 'pincodesaved' invisible  
    "code.popup.vis=false\n"       // Make the green popup window invisible  
    "page 'code'"                  // Redraw the code page  
);
```

Variant: 3,4 inch display in commercial case
